Introduction
The process of teachers' formation, second Pacheco and Flowers (1999), it involves complex changes of nature cognitive, affective and comportamental, that are processed along the course of the professional formation.

The teachers' formation locates in a partner-political-economical context that it is suffering deep changes curriculars to assist the new demands and constant transformations of the profession, especially after the years of 1970. In spite of that, the courses of initial formation have been making possible the student the structuring of theoretical and practical knowledge that orientate the pedagogic practice of the professional future.

During the degree course, the opportunities of learnings are addressed, in your majority, to the process of teaching of the physical education, in which contents, objectives, teaching methods and evaluation procedures are approached.

In what he/she refers to the evaluation procedures, so much the experiences lived through the practices evaluations used by teachers, as discussions related to the theme developed in the disciplines that compose the structure curricular they influence in the construction of the pedagogic practice of futures professional exits of degree courses.

In this sense, the objective of this investigation was to analyze the process of structuring of the practices evaluations of physical education professionals in all the teaching levels.

Methodology
For so much, they were involved in the investigation 8 (eight) teachers of School physical education, 18 (eighteen) college teachers and 9 (nine) students of the course of physical education of Unioeste.

The collection of the information was accomplished among April 06 to June 10 of the school year of 2005, through a semi-structured interview, using a portable tape recorder.

The time of duration of the interviews varied among 41 (forty and a) minutes the longest, accomplished with an academical teacher and 10 (ten) minutes the more it tans, accomplished with a student forming.

The route looked for to obtain information on the participants' of the research biography: (age, sex, civil status, title, work regime, sporting experience previous to the initial formation, years of professional experience and area of professional performance), the experiences related to the evaluation process (outstanding facts of the experiences lived during the course in relation to the practices evaluations in the construction of your pedagogic practice, the opportunities lived in your course of initial formation in relation to the learnings in evaluation, the characteristics of the evaluation process lived while student of the fundamental and medium teaching).

Subsequent the accomplishment of the interviews, there was the stage of transcription of the same ones in the complete, that happened among April 07 to July 29, 2005. The interviews were write firstly and, after your conclusion, they were typed in a text editor in the computer. They were only then returned for the participants of the study for they analyze the content and they confirm the information. Some participants accomplished grammatical corrections in the text, what was accepted and modified quickly by the researcher, coming back again for the same ones.

Results
The sporting experience and the existences were analyzed with the evaluation of the teaching fundamental, medium and superior.

In the analysis of the sporting experience, it was verified that the college teachers' group and of the students it presented higher number of subjects than they possess sporting experience previous to the initial formation, that the teachers exits.

Surprisingly the teachers' of School physical education group, presented less intentions in evaluating the physical acting and your students' technician, since they privileged to evaluate the participation in the classes, without considering in that level this participation was executed. In compensation, the students and educational teachers they worried more in evaluating the students' acting, especially through practical proofs.

However, some college teachers with sporting experience previous to the initial formation presented repudiation feeling and indignation in relation to the evaluation of the students' physical and technical acting.

So much the sporting experience with relationship to the experiences related to the human movement in general of the physical education classes, can influence the development of the process of professional formation in the area of the physical education.

This process begins starting from the personal experiences already lived in the childhood, especially those of the educational context in that the individual is inserted. In fact, the registered memories of the childhood and of the adolescence, they leave marks for the whole life and they can influence in the elaboration of concepts and point of view on several subjects.

In this sense, the construction of the knowledge related to the theme evaluation of the learning in the physical education, is executed with larger intensity in the school ambit, from the fundamental teaching to the medium teaching.

With the intention of identifying the possibility that the personal experiences were among the aspects influenced of the professional formation, more specifically in the structuring of the incorporate evaluation process in practice pedagogic of the physical education, they were included in the route of the interview accomplished with the participants of the investigation, topics, us which the same ones, they could tell your existences in relation to the theme, at that time in that were students of the fundamental and medium teaching.

Picture 2 - Personal Experiences concerning the evaluation in the fundamental and medium teaching

In the analysis of the personal experiences related to the evaluation lived in the fundamental and medium teaching, they identified in a general way some similarities among the participants' of the investigation depostions, since these were
exposed to evaluation systems in that the decisive element for the final concept was the analysis of the participation, usually through the teacher's observation in elapsing of the physical education classes.

In the teachers' and School physical education courses, in they just evaluate the participation in the physical education classes, it denotes the predominance of the aspects comportamentals and the individual's attitude in the evaluations in detriment to the other dimensions related to the process teaching and learning, namely the evolution and construction of general and specific knowledge related to the human movement.

In fact, the history of the area subsidizes these interpretations in the opinion of Castellani (1988), because she was marked since the beginning of your appearance by the disciplinary character stepped on in beginnings militarists of physical acting, technical and competitive.

In compensation, in spite of the disciplinary conception to be incorporate for the professionals and you identify her/bit before the common sense, the physical education developed as knowledge area, especially in what he/she concerns your link with the other areas, so much the one of the health with relationship the educational in general, incorporating other contents for they be developed in the classes and analyzed in the process evaluation, as for instance, the related to the acquisition and incorporation of habits of healthy life, or still, the cultural knowledge of the human movement, that they involve the sports, the dance, the gymnastics and corporal existences in general.

However, he/she identified a great probability that these contents are not being developed in the physical education classes, since the teachers didn't also demonstrate intention of you evaluate them. The teachers of School physical education, affirmed to evaluate only the returned aspects the student's dimension comportamental starting from the only and exclusive observance of the participation in the classes.

Another decisive aspect in the composition of the final concept and it leaves integral of the applied evaluation system to the interviewees, he/she concerns the analysis and verification of the physical and technical acting, returned to the competitive aspect, usually accomplished through practical proofs and physical tests.

In spite of this fact, it was noticed in a temporary and historical analysis in the participants' of the research significant changes different generations with passing of the years in the form of evaluating. However, it emerges of the analysis of the data a tendency of those to verify the intention of the actions in the physical education classes, since the higher indexes of evaluation for acting were verified in the college teachers and lower indexes in the teachers of School physical education and students. In fact, the development and incorporation of new paradigms for the area interfere in practice pedagogic, because they allow the rebuild of the concepts, contents, objectives, methods and evaluation strategies, finally of the own directions of the physical education classes. However, the participants' of the investigation little intentional was verified in noticing in the process evaluations the individual evolution and construction of knowledge, through changes of life habits and of the cultural aspects of the human movement.

The process of professional formation in the physical education is built so much by knowledge developed in the educational ambit as in extra-school atmosphere. Those acquired in the basic school course that begins in the fundamental teaching and it finishes in the medium teaching they are compose decisive in the future professional choices, since in this period the students go by intense personal modifications, building and elaborating your own concepts regarding the world that surrounds him/it, as well as discovering your aptitudes and personal potentialities. The choice of a profession is surrounded most of the time by doubts and uncertainties, because it is usually known few real information of the functions and attributions of each professional ambit.

Starting from the moment in that the choice of the profession is executed an arduous walk he/she begins heading for formation and professional qualification in the area of future performance.

In this sense, the experiences of the course of formation initial are outstanding, for the structuring of the professional performance. In the initial formation according to Nascimento (1998), the concern exists in developing specific knowledge of the area, since the characteristic principal of this stage is the preparation for the exercise or initial qualification of the profession.

In the case of the graduation in physical education, especially in the degree modality the main intention returns usually to the futures teachers' formation, therefore, the contents, objectives, teaching methods and the evaluation strategies need to contemplate the expectations and needs of the educational futures.

In spite of that, it was verified starting from the existences in the initial formation in all the participants' of the investigation physical education, that in many moments the development of competences returned to the future professional performance it was not considered as central point of the teaching process and learning, but to the opposite, the emphasis was in the development of physical capacities and abilities addressed exclusively to the sporting practice.

In this perspective, so much the contents, objectives and teaching methods with relationship to the evaluation strategies privileged the quantitative aspects through the analysis of the technical and physical acting.

In the first curricula of the physical education courses, most of the hourly load was destined the disciplines related to the sports, the sporting paradigm prevailed. This fact, is due in Betti’s opinion (1991) the origin militarist and of cultures comings of the exterior related the physical education, of this it sorts things out, the formation didn't belong to teachers, but physical coaches.

In the same way, in the entrance process for the course, the own college entrance exam was composed so much for theoretical proofs as for practical proofs, calls of previous. In that practical evaluation, the individual needed to accomplish activities coordination, of force, resistance, to swim, among others.

In relation to this aspect it was verified that just the college teachers and some teachers of School physical education, participated in that. However, since that evaluation was abolished starting from the decade of 1990, exempting the group of the students the experimentation of this gauging type. In spite of that, they continue being appraised in elapsing of the course how they were appraised your teachers college, through the analysis of the acting and retention of knowledge.

With the intention of analyzing the acquired experiences in the higher education in relation to the evaluation, he/she came necessary to identify so many it was evaluated, starting from the teachers' real intentions in evaluating, as they evaluated, through the procedures and instruments adopted in the evaluations of the several disciplines that compose the curriculum of the course.

The procedures more used in the evaluation process during the initial formation in physical education, so much in what he/she concerns the college teachers and teachers of School physical education, with relationship to the students were theoretical proofs and works in the disciplines that embrace contents of theoretical essence and you prove practices in the disciplines sporting or practical.

The use of these procedures evaluations in the courses of teachers' formation, revealed in first moment the privilege of the quantitative analysis in detriment of the qualitative analysis, especially in what he/she refers to the disciplines that involve sporting and cultural contents.
The focus exclusively quantitative, as well as the emphasis in the results obtained in just some moments evaluations it privileges the final product in detriment of the reflection returned to the process as a whole, built along the time in the educational relationships.

In fact, the analysis of the final product becomes just insufficient to observe the subject's individual evolution in elapsing of the teaching process and learning. The indications of own LDB (Law of Guidelines and Bases of the National Education), they emphasize the need of the incorporation of the continuous and cumulative character in the practices evaluations.

The own student ends if accommodating, according to Fensterseifer (1998) before the incoherences of the process to which is submitted and that it ends up harming your own formation, doing what the teacher demands, independent of your needs and interests.

Most of the physical education courses, in Oliveira’s opinion (1988) he/she bases on the education reproduction, conformist, prioritizing the technical aspect in the teaching process and learning in detriment of the pedagogic-methodological aspect.

The analysis of the personal experiences concerning the evaluation in the higher education involves as much the form as the academic it was evaluated with relationship to the discussions accomplished on the thematic.

Considering that, the initial formation seeks to prepare the professional future to act in the area of the physical education, countless competences returned to the teachers' formation they need to be developed. In this perspective, it appears the need of arrange spaces and moments for deepened discussions related to the elements that subsidize the pedagogic practice in a general way and specifically in what he/she refers to the evaluation of the learning.

In the analysis of the discussion opportunities on the thematic in subject, similarities were observed in the participants' of the investigation existence, since these detached the inadequacy of discussions on the subject during the whole degree course.

The practices evaluations are constituted it leaves integral of the teaching process that will be developed daily by the future physical education teacher. This way, the development of this content should be concern of the whole faculty in the most several disciplines, since each one can contribute with a focus or different point of view in the pedagogic discussions.

To the opposite, starting from the moment that the course ignores the need of these discussions, the futures teachers can present immense difficulties in the insert of the process evaluations when entering in the job market.

In compensation, the college teachers are resented of the lack of time and spaces or moments of discussions and reflections concerning the thematic evaluation in your daily one. Even in the meetings accomplished by the course co-ordination involving the faculty and students they privilege the bureaucratic subjects in detriment of the pedagogic ones.

In fact, there is not doubt in the opinion of Fensterseifer (1998) that is necessary we enlarge the discussions concerning the evaluation in the courses of initial formation in physical education, that you/they especially seek the teachers' formation.

Considering that the experiences lived in the period of initial formation, they can be inside and later reproduced in the daily educational through the pedagogic practice, he/she becomes primordial to the degree courses the accomplishment of reflections and constant discussions concerning the contents that are orientating the preparation for the work. The probability that the students place in practice the procedures that experienciam, in the opinion of Baggio (2000) it is much larger than those that just acquire knowledge through readings or in the conferences participation.

In this sense, being the initial formation in physical education a concerned course with the training of the professional futures, your actions need to turn in the sense of collaborating with the structuring of the pedagogic practices and consequently of the evaluation process. This way, it is noticed the need that during that process are opportunity activities of simulations or even existences of situations that the futures teachers will face in reality of the job market of the area in that the process evaluations will be present and constant.

In what he/she concerns the analysis of the process of structuring of the practices evaluations, the group of the students college was not questioned in this aspect, since they didn’t still structure the evaluation process, they only contributed with your opinions the college teachers and teachers of School physical education.

This situation was also found in the studies of Scherer (1999) on the physical education teachers’ pedagogic knowledge, evidencing that the educational experience seems to be to main knowledge source for the physical education teacher’s daily practice, starting from the one which during your professional path, he modifies your action strategies sustained, mainly in the reflection on your daily one.

**Conclusion**

Starting from the collected data convergences were verified in the participants’ of the investigation opinions, because the professional experience was considered as the factor that more it influenced or it contributed to the structuring of the practices evaluations, so much of the college teachers as of the teachers of School physical education.

In compensation, the influences and contributions of the course of initial formation in the structuring of the participants’ of the investigation practices evaluations, they were considered insufficient and little consistent, tends in view the relevance of the theme in the area of performance of the physical education. To the opposite, in many cases the initial formation contributed in a negative way in what he/she refers to the structuring of the practices evaluations. These considerations were considered harmful to the teaching process and learning, being the teachers would not like like this to repeat them or you incorporate them in your pedagogic practice.

He/she you identified through the participants’ of the investigation depositions, the easiness of the course of initial formation in physical education in developing knowledge on the process evaluations, since were told few discussions related to the theme and just accomplished in the discipline of Didactics. In this way, the experiences that the professional futures lived in relation to the practices evaluations they were centered in the examples of the own teachers college, through the evaluation systems that implemented.

In the same way it was observed that the opportunities to develop learnings about evaluation came restricted, for the fact that, in the proposed activities and developed by the own course that has for objective to supply the teachers in formation, close experiences of the reality of the job market, as the extension projects and he/she researches and the apprenticeships in the ones which, the professional futures get to carry out even teachers functions, the activity of evaluating is not opportunity or allowed, what hinders the development of knowledge vastly for the structuring of the future practices evaluations.
A formação inicial em Educação Física tem possibilitado ao estudante a estruturação de conhecimentos teóricos e práticos que orienta a prática pedagógica do futuro profissional. Em que se refere ao processo de avaliação, tanto as experiências vivenciadas através de várias das avaliações de práticas usadas por professores que proporcionam as classes dos cursos de formação inicial, assim como as discussões relacionadas ao tema desenvolvidas em disciplinas curriculares, influenciam na estruturação da prática pedagógica de futuros os profissionais de educação física. Em essa perspectiva, o objetivo de investigar era analisar o processo de estruturar de as avaliações de práticas de profissionais de educação física em todos os níveis de ensino. Para tanto, ele optou para usar uma metodologia descriptivo-interpretativa com um acercamiento qualitativo dos dados. Os participantes consistiram em saídas que fornecem classes em contextos urbanos ou rurais que proporcionam a experiência pedagógica de futuros professores de Educação Física. O instrumento utilizado na coleta dos dados consistiu em entrevistas semi-estruturadas. As perguntas que orientaram as entrevistas foram abertas, para obter respostas variadas sobre as práticas avaliativas. Como resultado, identificou-se que a experiência profissional foi considerada como um fator que mais influenciou ou contribuiu para a estruturação de práticas avaliativas, tanto dos docentes formadores quanto dos professores egresos.

**THE PROCESS OF STRUCTURING OF THE PRACTICE EVALUATIONS IN THE PHYSICAL EDUCATION: OF THE INITIAL FORMATION TO THE SCHOOL PEDAGOGICAL PRACTICE**

Summary: The initial formation in physical education has been making possible the student the structuring of theoretical and practical knowledge that orientate the pedagogic practice of the professional future. In what he/she refers to the evaluation process, so much the experiences lived through the practice evaluations used by teachers that supply classes in the courses of initial formation, as well as discussions related to the theme developed in disciplines curriculares, they influence in the structuring of the pedagogic practice of futures physical education professionals. In that perspective, the objective of this investigation was to analyze the process of structuring of the practice evaluations of physical education professionals in all the levels of education. For so much, she/she decided to use a descriptive-interpretative methodology with a qualitative approach of the data. The participants consisted of exits that supply classes in the public and private schools of the municipal district of Marechal Cândido Rondon - Pr, educational teachers of the career of the superior teaching that supply classes in the course, in the school period of the year of 2005, as well as the students enrolled and frequent in the 4th year of the course of physical education of Unioeste. The instrument used in the collection of the data it consisted of semi-structured interview. The questions that oriented the interviews were open, so on the practice evaluations were based, it was identified that the professional experience was considered as the factor that more it influenced or it contributed to the structuring of the practice evaluations, so much of the teachers college as of the teachers exits.
